THE CANADIAN CHEMISTRY CONTEST 2019

PART A – MULTIPLE CHOICE QUESTIONS (60 minutes)

All contestants should attempt this part of the contest before proceeding to Part B and/or Part C. The only reference material allowed is the CIC/CCO Periodic Table provided. You must complete answers on the Scantron Sheet provided. A scientific calculator is allowed. No phones or any devices that can be used for communication are allowed.

1) A solution is 0.0240 mol L⁻¹ KI and 0.0146 mol L⁻¹ MgI₂. What volume of water should be added to 100.0 mL of this solution to produce a solution with [I⁻] concentration of 0.0500 mol L⁻¹?

A) 106.4 mL  B) 53.2 mL  C) 26.6 mL  D) 13.3 mL  E) 6.4 mL

2) The boiling points of the compounds acetic acid (CH₃COOH), 1-pentanol (C₅H₁₁OH), dibutyl ether (C₈H₁₈O) and dodecane (C₁₂H₂₆) increase in that order. Which of the following statements provides the best explanation for this increase?

A) The London dispersion forces increase
B) The hydrogen bonding increases
C) The dipole-dipole forces increase
D) The chemical reactivity increases
E) The number of carbon atoms increases

3) Health Canada recommends that women between the ages of 12 and 45 consume 400 micrograms of folic acid (C₁₉H₁₉N₇O₆) per day, which reduces the risk of neural tube defects during pregnancy. How many moles of folic acid are equivalent to 400 micrograms?

A) 1.10 mmol  B) 0.177 mol  C) 0.906 mol  D) 0.906 mmol  E) 9.06 x 10⁻⁷ mol

4) An unknown amino acid contains 9.5 % nitrogen by mass as determined by elemental analysis. Which of the following could be the unknown amino acid?

A) arginine C₆H₁₄N₄O₂  B) cysteine C₃H₇NO₂S
C) histidine C₆H₉N₃O₂  D) glutamic acid C₅H₉NO₄
E) glycine C₂H₅NO₂

5) The melting point of CaS is higher than that of KCl. Explanations for this observation include which of the following?

I. Ca²⁺ is more positively charged than K⁺.
II. S²⁻ is more negatively charged than Cl⁻.
III. The K⁺ ion is smaller than the Ca²⁺ ion.

A) II only  B) I and II only  C) I and III only  D) II and III only  E) I, II, and III

6) Fluorine is the most electronegative element on the periodic table. As a result it always forms polar bonds with other non-metals. Despite this, which of the following fluorine containing compounds would be a non-polar molecule?

A) SF₄  B) PF₃  C) IF₅  D) BrF₃  E) XeF₄

7) Ronald James Gillespie, who developed Valence Shell Electron Pair Repulsion (VSEPR) theory, isolated the superacid fluorosulfuric acid (HSO₃F) when he combined fluorinated compounds with concentrated sulfuric acid, creating brightly coloured solutions. Which of the following best describes the molecular shape of fluorosulfuric acid, as predicted by VSEPR theory?

A) See saw  B) Trigonal bipyramidal  C) Tetrahedral
D) Square planar  E) Trigonal pyramidal

8) Vinegar used as a cooking ingredient, or in pickling, is a solution of 5% acetic acid (CH₃COOH) by mass in solution with water. The pKa = 4.76 for acetic acid at 25°C. Evaluate the pH of vinegar at 25°C.

A) 4.80  B) 4.15  C) 2.92  D) 2.42  E) 2.24
9) The ionization energies for period 3 element X are listed in the table below.

<table>
<thead>
<tr>
<th>Ionization Energies for element X (kJ mol⁻¹)</th>
</tr>
</thead>
<tbody>
<tr>
<td>First</td>
</tr>
<tr>
<td>580</td>
</tr>
</tbody>
</table>

Based on the data, which statement about element X is **FALSE**?

A) Its most common oxidation state is +3  
B) It is displaced from aqueous solution by copper metal  
C) It is the most abundant metal in the Earth’s crust  
D) Its oxide is insoluble in water  
E) It is a lustrous metal

10) Stavzor (structure below) is a medication primarily used to treat epilepsy and bipolar disorder.

![Stavzor](image)

A well-known substance with a characteristic odour of bananas (A) is a constitutional isomer of Stavzor. Which of the following is a possible structure for A?

(a) ![Structure](image)  
(b) ![Structure](image)  
(c) ![Structure](image)  
(d) ![Structure](image)  
(e) ![Structure](image)

11) Given the following electrochemical cell data:

<table>
<thead>
<tr>
<th>Cell</th>
<th>Redox Reaction</th>
<th>Standard Electrode Potential (V)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Cd(s)</td>
<td>Cd²⁺ (1.0M)</td>
</tr>
<tr>
<td>2</td>
<td>Zn(s)</td>
<td>Zn²⁺ (1.0 M)</td>
</tr>
<tr>
<td>3</td>
<td>Zn(s)</td>
<td>Zn²⁺ (1.0 M)</td>
</tr>
</tbody>
</table>

Determine the standard cell potential for Cell 3.

A) – 0.36 V  
B) 0.36 V  
C) –1.84 V  
D) –0.18 V  
E) 0.18 V

12) Lead (II) sulfate can decompose into lead (II) sulfite and oxygen gas when heated. If the reaction generates 2.25 g of oxygen gas, what mass of lead (II) sulfate reacted? Assume 100% yield in this reaction.

A) 42.6 g  
B) 21.3 g  
C) 20.2 g  
D) 10.7 g  
E) 4.50 g

13) A student combines 75 mL of 0.500 mol L⁻¹ hydrochloric acid with 55 mL of 0.125 M KOH. What is the pH of the resulting solution?

A) 0.30  
B) 0.39  
C) 0.63  
D) 1.51  
E) 7.00

14) A system undergoes a reversible cyclic process and proceeds through a series of thermodynamic processes, exchanging heat and work with its surroundings and ultimately returning to its original state. Which one of the following statements is true? Assume that the surroundings are much larger than the system.

A) ∆Sₜₜₜₜ > 0  
B) q > 0  
C) q < 0  
D) q = w = 0  
E) ∆S > 0

15) The thermite reaction is the reaction of aluminum metal and iron (III) oxide:

\[ 2\text{Al} (s) + \text{Fe}_2\text{O}_3 (s) \rightarrow \text{Al}_2\text{O}_3 (s) + 2\text{Fe} (s) \quad \Delta H = -852 \text{ kJ} \]

A teacher does a demonstration with 1.00 mol of iron (III) oxide and 2.00 mol of aluminum metal both initially at 25.0 °C. If the combined specific heat of the products is 0.800 J g⁻¹ °C⁻¹ over a wide range of temperatures, what is the final temperature of the products?

A) 3550 °C  
B) 4960 °C  
C) 5010 °C  
D) 6470 °C  
E) 6500 °C
16) The compound acetanilide is important in the industrial synthesis of several dyes. Acetanilide (mol. wt. = 135.16) can be made in the laboratory by a reaction between aniline and excess acetic anhydride which has a yield of 61.5%:

\[
\begin{array}{c}
\text{NH}_2 \\
\text{aniline}
\end{array}
+ \begin{array}{c}
\text{O} \\
\text{O}
\end{array}
\begin{array}{c}
\text{anhydride}
\end{array}
\rightarrow
\begin{array}{c}
\text{N} \\
\text{H}
\end{array}
\begin{array}{c}
\text{O}
\end{array}
\begin{array}{c}
\text{acetanilide}
\end{array}
\]

Aniline and acetic anhydride are both liquids which have densities of 1.219 g mL\(^{-1}\) and 1.082 g mL\(^{-1}\) respectively.

What volume of aniline was used in this reaction if the recorded mass of acetanilide product was 7.14 g?

A) 4.03 mL  B) 9.75 mL  C) 4.92 mL  D) 5.99 mL  E) 6.56 mL

17) One of the Twelve Principles of Green Chemistry is that "synthetic methods should be designed to maximize the incorporation of all materials used in the process into the final product". One way to consider this is to calculate the atom economy (AE) of a chemical reaction where AE is defined as follows:

\[
\text{atom economy} = \frac{\text{molecular mass of desired product}}{\text{molecular mass of all reactants}} \times 100\%
\]

The atom economy of the reaction in the previous question (#16) is:

A) 61.5%  B) 69.2%  C) 100%  D) 68.9%  E) 74.4%

18) Given the following set of equilibria and their respective constants

\[
\begin{align*}
\text{NH}_4^+ & \rightleftharpoons \text{H}^+ + \text{NH}_3 & K_a &= 5.6 \times 10^{-10} \\
\text{H}_2\text{CO}_3 & \rightleftharpoons \text{H}^+ + \text{HCO}_3^- & K_{a1} &= 4.2 \times 10^{-7} \\
\text{HCO}_3^- & \rightleftharpoons \text{H}^+ + \text{CO}_3^{2-} & K_{a2} &= 2.4 \times 10^{-8}
\end{align*}
\]

what would the equilibrium constant be for the reaction below?

\[
\text{H}_2\text{CO}_3 + 2 \text{NH}_3 \rightleftharpoons (\text{NH}_4)_2\text{CO}_3
\]

A) 1.8 x 10\(^{-5}\)  B) 4.4 x 10\(^{-7}\)  C) 9.0 x 10\(^{-6}\)  D) 3.2 x 10\(^4\)  E) 3.1 x 10\(^{-5}\)

19) The subshell filling order used for the quantum mechanical model of the atom is an approximation of the relative subshell energies, which assumes the energies remain fixed. However, there are exceptions to the Aufbau Principle. Which of the following is the correct ground state configuration of an element found on the periodic table?

A) [Ar] 4s\(^1\) 3d\(^5\)  B) [Ar] 4s\(^2\) 3d\(^4\)  C) [Ar] 4s\(^2\) 4d\(^4\)  D) [Ar] 4s\(^2\) 4p\(^4\)  E) [Ar] 4s\(^1\) 4p\(^5\)

20) A vessel contains 2.50 mol of O\(_2\) gas, 0.50 mol of N\(_2\) gas and 1.00 mol of CO\(_2\) gas. The total pressure is 200 kPa. The partial pressure exerted by the O\(_2\) in the mixture is:

A) 25 kPa  B) 50 kPa  C) 100 kPa  D) 125 kPa  E) 150 kPa
21) The O₂ (g) produced in the decomposition of 3.275 g mixture of potassium chlorate and potassium chloride which is 65.82% KClO₃ by mass is collected over water at 21.0 °C. Assume ideal gas conditions. If atmospheric pressure is 753.5 mmHg, water vapour pressure at 21.0°C is 18.7 mmHg, once the pressure in the gas collection vessel was equalized with atmospheric pressure, how many milliliters of O₂ gas would be produced according to the reaction:

\[ 2 \text{KClO}_3 (s) \rightarrow 2 \text{KCl (s)} + 3 \text{O}_2 (g) \]

A) 130 mL B) 439 mL C) 563 mL D) 658 mL E) 1320 mL

22) The equilibrium CO (g) + NO₂ (g) \rightarrow CO₂(g) + NO (g) is established in four different, but identical containers. Each container started with a different composition as follows:

<table>
<thead>
<tr>
<th>Container</th>
<th>CO (mol)</th>
<th>NO₂ (mol)</th>
<th>CO₂ (mol)</th>
<th>NO (mol)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1</td>
<td>1</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>2</td>
<td>1</td>
<td>0</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>3</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>4</td>
<td>0</td>
<td>1</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>5</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

After equilibrium is established, which container would have the largest concentration of CO (g)

A) 1 B) 2 C) 3 D) 4 E) 5

23) For the reaction H₂ (g) + I₂ (g) \rightarrow 2 HI (g) \hspace{1cm} \Delta H^\circ = +52.96 \text{kJ.}
Which of the following statement(s) is/are correct?

I. The heat of formation of 1 mol of HI is +26.48 kJ
II. As the temperature increases, the reaction will proceed to the right
III. As the pressure increases, the reaction will proceed to the right

A) I only B) I and II only C) I, II and III D) II and III only E) III only

24) Calculate \(\Delta G^\circ\) at 25 °C for the reaction given the data below

\[ 4 \text{HCl (g)} + \text{O}_2 (g) \rightarrow 2 \text{Cl}_2 (g) + 2 \text{H}_2\text{O (g)} \hspace{1cm} \Delta H^\circ = -114.4 \text{kJ} \]

\[ S^\circ_{\text{Cl}_2} = 223.0 \text{ J mol}^{-1} \text{K}^{-1} \]
\[ S^\circ_{\text{H}_2\text{O}} = 188.7 \text{ J mol}^{-1} \text{K}^{-1} \]
\[ S^\circ_{\text{HCl}} = 205.0 \text{ J mol}^{-1} \text{K}^{-1} \]

\[ A) + 14.4 \text{kJ} \hspace{1cm} B) -111.18 \text{kJ} \hspace{1cm} C) + 3105.6 \text{kJ} \hspace{1cm} D) + 38 \text{kJ} \hspace{1cm} E) - 76.0 \text{kJ} \]

25) For the reaction 2 NO (g) + Cl₂ (g) \rightarrow 2 NOCl (g) the table below provides experimental data for 3 different reactions.

<table>
<thead>
<tr>
<th>Experiment</th>
<th>[NO] (mol L⁻¹)</th>
<th>[Cl₂] (mol L⁻¹)</th>
<th>Initial Rate (mol L⁻¹s⁻¹)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>0.0125</td>
<td>0.0128</td>
<td>1.14 x 10⁻⁵</td>
</tr>
<tr>
<td>2</td>
<td>0.0125</td>
<td>0.0511</td>
<td>4.55 x 10⁻⁵</td>
</tr>
<tr>
<td>3</td>
<td>0.0250</td>
<td>0.0255</td>
<td>9.08 x 10⁻⁵</td>
</tr>
</tbody>
</table>

What is the rate constant for the reaction?

A) 140 L mol⁻¹ s⁻¹ B) 0.0714 L mol⁻¹ s⁻¹ C) 5.70 L² mol⁻² s⁻¹
D) 0.562 L mol⁻¹ s⁻¹ E) 1.39 L² mol⁻² s⁻¹
