# THE CANADIAN CHEMISTRY CONTEST 2022 for high school and CEGEP students 

## PART C: CANADIAN CHEMISTRY OLYMPIAD Final Selection Examination 2022

## (120 minutes)

This segment has five (5) questions. While students are expected to attempt all questions for a complete examination in 2 hours, it is recognized that backgrounds will vary and students will not be eliminated from further competition because they have missed parts of the paper.

Your answers are to be written in the spaces provided on this paper. All of the paper, is to be returned immediately by upload.

## - PLEASE READ -

1. BE SURE TO COMPLETE THE INFORMATION REQUESTED AT THE BOTTOM OF THIS PAGE BEFORE BEGINNING PART C OF THE EXAMINATION.
2. STUDENTS ARE EXPECTED TO ATTEMPT ALL QUESTIONS OF PART A AND PART C. CREDITABLE WORK ON A LIMITED NUMBER OF THE QUESTIONS MAY BE SUFFICIENT TO EARN AN INVITATION TO THE NEXT LEVEL OF THE SELECTION PROCESS.
3. IN QUESTIONS WHICH REQUIRE NUMERICAL CALCULATIONS, BE SURE TO SHOW YOUR REASONING AND YOUR WORK.
4. ONLY NON-PROGRAMMABLE CALCULATORS MAY BE USED ON THIS EXAMINATION.
5. PART A DATASHEET IS THE ONLY DATASHEET THAT MAY BE USED ON THIS EXAMINATION.

PART A $\underset{\text { Correct Answers }}{( }$

## 1. ORGANIC CHEMISTRY

a) Starting with pyridine and any non-cyclic organic reagents with 6 or less carbon atoms, devise a synthesis of nicotine without stereochemistry. You may use any inorganic reagents you wish. Clearly draw the entire scheme containing reagents and intermediates. 6 marks

Official answer (other correct answers may also be accepted)
b) Starting with hexan-1,5-diol and any organic and inorganic reagents you wish, devise a synthesis of menthol without stereochemistry. Clearly draw the entire scheme containing reagents and intermediates. 4 marks

Hint: here's a reaction that may be useful; a gilman reagent is a lithium dialkyl cuprate salt that can perform conjugate addition reactions like so:

Where $R, R_{1}$ and $R_{2}$ are different alkyl groups.

Official answer (other correct answers may also be accepted)
c) The following structures are all stereoisomers of menthol. Assuming that all these structures are in their most stable conformations, circle the most stable stereoisomer. 2 marks

## 2. ANALYTICAL CHEMISTRY

Colorless crystal $\mathbf{A}$ undergoes a thermal decomposition reaction to produce two gases $\mathbf{B}$ and C. When gas $\mathbf{B}$ is further heated to a higher temperature and then cooled down to the original temperature, the volume the gases increase by $50 \%$. Although $\mathbf{A}$ is commonly used in agriculture as a fertilizer, it nevertheless is an oxidizing agent. A dissolve easily in water and causes the temperature of the solution to decrease noticeably and the resulting solution is slightly acidic (pH between 4.5 and 5.0 ). Heating equal moles of $\mathbf{A}$ and solid NaOH produces a gas $\mathbf{D}$ with unpleasant odor and a white solid $\mathbf{E}$. When gas $\mathbf{D}$ is introduced into a AgNO 3 solution, a dark brown solid $\mathbf{F}$ is formed. However, when gas $\mathbf{D}$ is continuously introduced, a colorless solution is obtained. Heating solid $\mathbf{E}$ produces colorless gas $\mathbf{G}$ which is essential for combustion reaction and a white solid $\mathbf{H}$. When $\mathbf{H}$ is treated with concentrated nitric acid, a brown color gas is evolved.
a) Based on information given, please identify $\mathbf{A}, \mathbf{B}, \mathbf{C}, \mathbf{D}, \mathbf{E}, \mathbf{F}, \mathbf{G}$ and $\mathbf{H}$.

4 marks ( 0.5 each)
A: $\mathbf{N H}_{4} \mathrm{NO}_{3}$
B: $\mathrm{N}_{2} \mathrm{O}$
C: $\mathrm{H}_{2} \mathrm{O}$
D: $\mathrm{NH}_{3}$
$\mathrm{E}: \mathrm{NaNO}_{3}$
F: $\mathrm{Ag}_{2} \mathrm{O}$

G: $\mathrm{O}_{2}$
$\mathrm{H}: \mathrm{NaNO}_{2}$
b) Write the chemical reaction equations for the following 4 marks ( 0.6 each, 0.4 last question)

Reaction to produce $\mathbf{B} \& \mathbf{C}$
$\mathrm{NH}_{4} \mathrm{NO}_{3}(\mathrm{~s}) \rightarrow \mathrm{N}_{2} \mathrm{O}(\mathrm{g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{g})$

Reaction for heating B to increase the volume by $50 \%$
$2 \mathrm{~N}_{2} \mathrm{O}(\mathrm{g}) \rightarrow 2 \mathrm{~N}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g})$

Reaction to produce D \& E
$\mathrm{NH}_{4} \mathrm{NO}_{3}(\mathrm{~s})+\mathrm{NaOH}(\mathrm{s}) \rightarrow \mathrm{NH}_{3}(\mathrm{~g})+\mathrm{NaNO}_{3}(\mathrm{~s})+\mathrm{H}_{2} \mathrm{O}(\mathrm{g})$

Reaction to produce $F$
$2 \mathrm{Ag}^{+}(\mathrm{aq})+2 \mathrm{NH}_{3}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \rightarrow \mathrm{Ag}_{2} \mathrm{O}(\mathrm{s})+2 \mathrm{NH}_{4}{ }^{+}(\mathrm{aq})$

Reaction of $\mathbf{F}$ to produce the colorless solution
$2 \mathrm{Ag}_{2} \mathrm{O}(\mathrm{s})+4 \mathrm{NH}_{3}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \rightarrow 2\left[\mathrm{Ag}\left(\mathrm{NH}_{3}\right)_{2}\right]^{+}+2 \mathrm{OH}^{-}(\mathrm{aq})$

Reaction of $\mathbf{E}$ to produce $\mathbf{G}$ and $\mathbf{H}$
$2 \mathrm{NaNO}_{3}(\mathrm{~s}) \rightarrow 2 \mathrm{NaNO}_{2}(\mathrm{~s})+\mathrm{O}_{2}(\mathrm{~g})$

Reaction of $\mathbf{H}$ to produce the brown color gas
$\mathrm{NaNO}_{2}(\mathrm{~s})+2 \mathrm{HNO}_{3}(\mathrm{aq}$, concentrated $) \rightarrow \mathrm{NO}_{2}(\mathrm{~g})+2 \mathrm{NaNO}_{3}(\mathrm{aq})+\mathrm{NO}(\mathrm{g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})$

Leucine $\left(\mathrm{CH}_{3}\right)_{2} \mathrm{CHCH}_{2} \mathrm{CH}\left(\mathrm{NH}_{2}\right) \mathrm{COOH}$ is on the top list of essential amino acids for human body. Leucine contains a carboxylic acid functional group and an amine functional group and has a $\mathrm{pK}_{\mathrm{a}}=2.36$ and $\mathrm{pK}_{\mathrm{b}}=4.40$. Leucine has been used in the food industry and as healthy supplement.
c) Using your knowledge of Charge Balance and/or Mass Balance, calculate the pH of a 0.100 M aqueous Leucine solution. Show your detailed work to earn full marks.

## 2.5 marks

Leucine will dissolve and form Zwitterion $\left(\mathrm{CH}_{3}\right)_{2} \mathrm{CHCH}_{2} \mathrm{CH}\left(\mathrm{NH}_{3}{ }^{+}\right) \mathrm{COO}^{-}$

Charge balance
$\left[\mathrm{A}^{-}\right]+\left[\mathrm{OH}^{-}\right]=\left[\mathrm{A}^{+}\right]+\left[\mathrm{H}^{+}\right] \quad$ (1.0 point)
$\mathrm{Ka}=\left[\mathrm{A}^{-}\right]\left[\mathrm{H}^{+}\right] /[\mathrm{A}]$
$\left[\mathrm{A}^{-}\right]=\mathrm{Ka}[\mathrm{A}] /\left[\mathrm{H}^{+}\right]$
$\mathrm{Kb}=\left[\mathrm{A}^{+}\right]\left[\mathrm{OH}^{-}\right] /[\mathrm{A}]$
$\left[\mathrm{A}^{+}\right]=\mathrm{Kb}[\mathrm{A}] /\left[\mathrm{OH}^{-}\right]$

## Approximation

Since $\left[\mathrm{A}^{+}\right] \gg\left[\mathrm{H}^{+}\right]$and $\left[\mathrm{A}^{-}\right] \gg\left[\mathrm{OH}^{-}\right]$
$\left[\mathrm{A}^{+}\right] \approx\left[\mathrm{A}^{-}\right]$
$\mathrm{Kb}[\mathrm{A}] /\left[\mathrm{OH}^{-}\right]=\mathrm{Ka}[\mathrm{A}] /\left[\mathrm{H}^{+}\right]$
$\mathrm{Kb}[\mathrm{A}][\mathrm{H}+] / \mathrm{kw}=\mathrm{Ka}[\mathrm{A}] /\left[\mathrm{H}^{+}\right]$
$\left[\mathrm{H}^{+}\right]^{2}=\mathrm{Ka}[\mathrm{A}] * \mathrm{Kw} / \mathrm{Kb}[\mathrm{A}]$
$\left[\mathrm{H}^{+}\right]=(\mathrm{Ka} * \mathrm{Kw} / \mathrm{Kb})^{1 / 2}$
(0.5 points)
$\mathrm{pH}=5.98$
(0.5 points)

Any correct final pH value within an error of $\pm 0.02$ will get 0.5 points.

In a lab, there are $0.100 \mathrm{M} \mathrm{NaOH}, 0,120 \mathrm{M} \mathrm{HCl}$, oxalic acid primary standard $\left(\mathrm{H}_{2} \mathrm{C}_{2} \mathrm{O}_{4} \cdot 2 \mathrm{H}_{2} \mathrm{O}\right.$, $126.07 \mathrm{~g} / \mathrm{mol}$ ), Potassium Hydrogenphthalate primary standard ( $\mathrm{KHC}_{8} \mathrm{H}_{4} \mathrm{O}_{4}, 204.22 \mathrm{~g} / \mathrm{mol}$ ), Tris(hydroxymethyl)-aminomethane primary standard (Tris. $\left(\mathrm{HOCH}_{2}\right)_{3} \mathrm{CNH}_{2}, \mathrm{~kb}=1.15 \times 10^{-6}$, $121.14 \mathrm{~g} / \mathrm{mol}$ ), Sodium Carbonate primary standard $\left(\mathrm{Na}_{2} \mathrm{CO}_{3}, 155.99 \mathrm{~g} / \mathrm{mol}\right)$, and three indictors, Phenolphthalein ( $\mathrm{pK}_{\mathrm{a}}=9.4$ ), methyl orange ( $\mathrm{pK}_{\mathrm{a}}=3.4$ ) and methyl red ( $\mathrm{pK} \mathrm{a}_{\mathrm{a}}=4.95$ ).
d) The purity of Leucine, which is going to be used in making dietary supplement, is to be determined by titration. A 2.000 g of Leucine is taken to make a 250.00 mL aqueous solution. Which of the afore listed chemicals would you use as the titrant? Which would you use as the indicator?

## 0.5 mark

Since the solution is acidic, so NaOH would be chosen as the titrant and Phenolphthalein would be chosen as the indicator.
(0.25 points for each correct answer)
e) Which of the primary standards would you use to standardize your titrant?

## 0.5 mark

To standardize NaOH , either Oxalic Acid primary standard or Potassium Hydrogenphthalate primary standard will be chosen.
(either one gets full points)
f) If 14.94 mL of the titrant is required to reach the equivalence point for a 25.00 mL aliquot of the analyte, what is the purity of the Leucine sample?

## 0.5 mark

0.01494 * 0.100 * 10 *131.17 / $2.000=97.98 \%$
(97.48 ~ 98.48\% gets full points)

## 3. INORGANIC CHEMISTRY

The Monsanto process is a famous industrial catalytic cycle. The process is presented below:

Please answer the following questions pertaining to the Monsanto process:
a) Write the overall balanced equation for the Monsanto process.

1 mark
$\mathrm{CH}_{3} \mathrm{OH}+\mathrm{CO} \rightarrow \mathrm{CH}_{3} \mathrm{COOH}$
b) For complex A, state which of its ligands are weak field and which are strong field, and also state whether the complex is a cis or trans isomer.
1 mark
iodide is weak field and CO is strong field ( 0.25 points each). The complex is in cis conformation ( 0.5 points).
c) For complex B, draw its crystal field splitting diagram, making sure to fill in the electrons and label each d orbital. Hint: complex $B$ is diamagnetic.
2 marks

$$
t_{2 g} d_{x y}, d_{x z}, d_{y z}
$$

This is just a typical low spin octahedral CFT diagram, with 6 electrons filling the $\mathrm{t}_{2 \mathrm{~g}}$ set. 1 point for the d-orbital splitting, 0.5 points for labelling the orbitals correctly, and 0.5 points for filling in the electrons properly.
d) For complex C, state its geometry and coordination number.

1 mark
the geometry is square pyramidal ( 0.5 points) and the coordination number is 5 ( 0.5 points).
e) For complex D, state the metal's oxidation state and d-electron count.

1 mark
the oxidation state is +3 ( 0.5 points) and the d-electron count is 6 ( 0.5 points).

Rhodium, the metal used in the Monsanto process, crystallizes into the face centered cubic structure as shown below:

The lattice parameter (unit cell length) of the crystal is 0.380 nm .
f) State the number of atoms present in the unit cell.
0.5 mark
g) State the coordination number of Rh in the crystal.
0.5 mark
h) Calculate the density of Rh in $\mathrm{g} \mathrm{cm}^{-3}$.

2 marks
mass/volume: $(4 \times 102.9) /\left(6.02214 \times 10^{23} \times\left(0.380 \times 10^{-7}\right)^{3}\right)=12.5 \mathrm{~g} \mathrm{~cm}^{-3}$
1 point for general mass/volume expression, 0.5 points for correct answer, 0.5 points for correct units.
i) Calculate the volume of empty space in the unit cell of Rh in $\mathrm{nm}^{3}$. Hint: the volume of a sphere with radius $r$ is given by: $V=\frac{4}{3} \pi r^{3}$ 3 marks

Rh atomic radius $=0.380 \mathrm{x} \sqrt{2} / 4=0.134 \mathrm{~nm}$ ( 1.5 points )
volume occupied by atoms: $4 \times \frac{4}{3} \pi \times 0.134^{3}=0.0406 \mathrm{~nm}^{3} \quad(0.5$ points $)$
volume of unit cell: $0.380^{3}=0.0549 \mathrm{~nm}^{3} \quad$ ( 0.5 points)
volume of empty space: $0.0549-0.0406=0.0143 \mathrm{~nm}^{3} \quad(0.5$ points $)$

Page 10 of 16

## 4. ORGANIC CHEMISTRY and NMR spectroscopy

a) The total synthesis of Gymnomitrol combines a wide variety of synthesis techniques. In step 1, only one side is reacted. Over the reaction sequence, a Michael addition and enolate attack are performed consecutively. Later in the sequence, an aldol addition is used to further cyclize the molecule. Given starting compound $A$ and the following reaction sequence, identify compounds C, D, F, G, I, J and K. Structures $\mathbf{L}_{\mathbf{1}}$ and $\mathbf{L}_{2}$ are both possible products from precursor K. Draw them both and note which one reacts to form Gymnomitrol.
9 marks

 (2) $\begin{aligned} & \text { 1) } \mathrm{CuBr}, \mathrm{BrMg} \\ & \text { 2) } \mathrm{MeI}\end{aligned}$

$+$

Gymnomitrol
b) Step 2 in the synthesis of Gymnomitrol is known as a Wolff-Kishner Reduction. Draw the complete reaction mechanism.
1 mark

1 point; 0.5 points for hydrazone formation, 0.5 points for deprotonation and condensation
c) The selected hydrogen atoms all appear in the condensed H-NMR spectrum. Fill in the table with the hydrogen atoms' corresponding H-NMR peaks.

## 2 marks

Gymnomitrol
Chemical shift options for peaks:
5.00, 3.72, 1.65 and 2.53 ppm

| Hydrogen <br> atom | Chemical shift of peak <br> $(\mathrm{ppm})$ |
| :---: | :---: |
| a. | 3.72 |
| b. | 1.65 |
| c. | 2.53 |
| d. | 5.00 |

Page 12 of 16

## 5. PHYSICAL CHEMISTRY

The following $2^{\text {nd }}$-order reaction: $A(g) \rightarrow 2 B(g)$ was carried out at $\mathrm{T}=27^{\circ} \mathrm{C}$ in a reaction vessel of constant volume. At the beginning of the reaction, only $A(g)$ at $P=1 \mathrm{~atm}$ was present. After 100 minutes of reaction, the total pressure $P$ in the vessel reaches 1.5 atm . Assume that both $\mathrm{A}(\mathrm{g})$ and $\mathrm{B}(\mathrm{g})$ are ideal gases.
a) Determine the half-life $\mathrm{t}_{1 / 2}$ and the rate constant k of the reaction at $27^{\circ} \mathrm{C}$. State your units in atmosphere and minutes.
3 marks

|  | A | $\rightarrow$ | 2B | $P$ | Or: |
| :---: | :---: | :---: | :---: | :---: | :---: |
| I | 1 atm |  | 0 | 1 atm |  |
| C | -x |  | +2x | +0.5 |  |
| E | 1-x |  | 2x | 1.5 atm | $P_{B}=2\left(1-P_{A}\right)$ |
|  |  |  |  |  | $P_{A}+P_{B}=1.5 \Rightarrow$ |
|  | $x+2 x$ | $=1$ |  |  | $P_{A}+2\left(1-P_{A}\right)=1.5 \mathrm{~atm}$ at 100 min |
|  | $x=1.5$ |  |  |  | $P_{A}+2-2 P_{A}=1.5$ |
|  | 0.5 atm |  |  |  | $2-1.5=P_{A}$ |
| $P_{A}($ | 100 min | ) $=$ | $1-0$ | $5=0.5 \mathrm{~atm}$ | $P_{A}(100 \mathrm{~min})=0.5 \mathrm{~atm}$ |

$$
2^{\text {nd }} \operatorname{order} k=\frac{1}{\frac{t_{1} P_{A}(0 \mathrm{~min})}{}}=\frac{1}{100 \times 1}=0.01 \mathrm{~atm}^{-1} \mathrm{~min}^{-1}
$$

Remove 0.5 mark for missing or wrong units
b) Give the rate constant $k$ using moles, litres and seconds for the units. 1 mark

$$
\begin{aligned}
& {[A]_{0}=\frac{n}{V}=\frac{P_{A}(0 \mathrm{~min})}{R T}=\frac{1}{0.08206 \times 300}=0.0406 \frac{\mathrm{~mol}}{\mathrm{~L}}} \\
& \text { or }=\frac{101325}{8.314 \times 300 \times 1000 \mathrm{~L} / \mathrm{m}^{3}}=0.0406 \frac{\mathrm{~mol}}{\mathrm{~L}} \\
& t_{\frac{1}{2}}=100 \mathrm{~min}=6000 \mathrm{~s}
\end{aligned}
$$

$$
k=\frac{1}{t_{\frac{1}{2}}[A]_{0}}=\frac{1}{6000 \times 0.0406}=4.1 \times 10^{-3} \mathrm{~mol}^{-1} \mathrm{Ls}^{-1} \text { or } 0.0041 \mathrm{~mol}^{-1} \mathrm{Ls}^{-1}
$$

Remove 0.5 mark for missing or wrong units

Consider a closed container of fixed size in contact with its surroundings maintained at a temperature of 298 K . The inside of this container is partitioned by a frictionless, movable wall into two compartments labeled 1 and 2, with initial volumes of $V_{1}=5 L$ and $V_{2}=1 L$, respectively. In compartment 1, there is a gaseous equilibrium mixture of molecules $A$ and $B$ with a total pressure of 1 atm . In compartment 2 , there is a gas of only compound $C$ also with a pressure of 1 atm . A piece of metal catalyst of negligible volume is then introduced into compartment 2 which causes gas $C$ to decompose into gaseous product $D$ in an equilibrium reaction. This pushes the wall against compartment 1, which increases $V_{2}$ and decreases $V_{1}$, also shifting the $A \rightleftharpoons B$ equilibrium as according to Le Chatelier's principle. The wall is pushed until the reactions in both compartments reach a new state of equilibrium. The standard changes in Gibbs free energies for the two equilibria are:

$$
\begin{array}{ll}
A(g) \rightleftharpoons 2 B(g) & \Delta G_{1}^{o}=-5.183 \mathrm{~kJ} / \mathrm{mol} \\
C(g) \rightleftharpoons 3 D(g) & \Delta G_{2}^{o}=-5.636 \mathrm{~kJ} / \mathrm{mol}
\end{array}
$$

Assume all gases are ideal.
c) Calculate the initial number of moles for C .

1 mark

$$
\begin{gathered}
n=\frac{P V}{R T}=\frac{1 \times 1}{0.08206 \times 298}=0.0409 \mathrm{~mol} \\
\quad \text { or }=\frac{101325 \times 0.001}{8.3145 \times 298}=0.0409 \mathrm{~mol}
\end{gathered}
$$

Remove 0.5 mark for missing or wrong units
d) Calculate the equilibrium constant for reaction 1 and 2.

## 1 mark

$$
\begin{array}{cc}
\Delta G^{o}=-R T \ln (K) \Rightarrow \ln (K)=\frac{-\Delta G^{o}}{R T} \Rightarrow \\
K_{1}=e^{-\frac{\Delta G_{1}^{o}}{R T}}=e^{\frac{5183}{8.3145 \times 298}}=8.10 & 0.5 \mathrm{mark} \\
K_{2}=e^{-\frac{\Delta G_{2}^{o}}{R T}}=e^{\frac{5636}{8.3145 \times 298}}=9.72 & 0.5 \mathrm{mark}
\end{array}
$$

e) Calculate the initial number of moles for $A$ and $B$.

2 marks

$$
\begin{aligned}
& K_{1}=\frac{P_{B}^{2}}{P_{A}}=8.1 \text { and } P_{B}+P_{A}=1 \mathrm{~atm} \\
& \frac{P_{B}^{2}}{P_{A}}=\frac{P_{B}^{2}}{1-P_{B}}=8.1 \Rightarrow P_{B}^{2}=8.1-8.1 P_{B} \Rightarrow P_{B}^{2}+8.1 P_{B}-8.1=0
\end{aligned}
$$

use quadratic equation to solve with $a=1, b=8.1$ and $c=-8.1$

$$
\sqrt{b^{2}-4 a c}=9.9 \text { the solution is: } P_{B}=\frac{-8.1+9.9}{2}=0.9 \mathrm{~atm}
$$

(The other root gives a negative pressure.)

$$
\begin{gathered}
P_{A}=1-0.9=0.1 \mathrm{~atm} \\
n=\frac{P V}{R T}
\end{gathered}
$$

$n_{A}=\frac{P_{A} V}{R T}=\frac{0.1 \times 5}{0.08206 \times 298}=0.0204 \mathrm{~mol}$ or $\frac{0.1 \times 101325 \times 0.005}{8.3145 \times 298}=0.0204 \mathrm{~mol}$
$n_{B}=\frac{P_{B} V}{R T}=\frac{0.9 \times 5}{0.08206 \times 298}=0.184 \mathrm{~mol}$ or $\frac{0.9 \times 101325 \times 0.005}{8.3145 \times 298}=0.184 \mathrm{~mol}$
Remove 0.5 mark for missing or wrong units
We know that $V_{2}$ will increase and $V_{1}$ will decrease. To get a better idea of how the system may evolve we can define $V_{\max }$, the maximum volume of compartment 2 and $V_{\min }$ the minimum volume of compartment 1 . To answer f ) and g ) assume that both compartments are independent from one another and the sum of their volumes is not restricted.
f) Calculate the value of $V_{\max }$, the maximum volume of compartment 2 at 1 atm. 1 mark

Initial moles of $C, n_{C}=0.0409 \mathrm{~mol}$
$C \rightarrow 3 D$, therefore if the reaction is complete $n_{D}=3 n_{C}=3 \times 0.0409=0.1227 \mathrm{~mol}$

$$
V_{\max }=\frac{n_{D} R T}{P}
$$

at 1 atm and $298 \mathrm{~K}, \quad V_{\max }=\frac{0.1227 \times 0.08206 \times 298}{1}=3 L$
Page 15 of 16
g) Calculate the value of $V_{\text {min }}$, the minimum volume of compartment 1 at 1 atm. 1 mark

Initial moles of $A$ and $B, n_{A}=0.0204 \mathrm{~mol}$ and $n_{B}=0.184 \mathrm{~mol}$
$2 B \rightarrow A$, therefore if the reaction is complete $n_{A}=0.0204+\frac{n_{B}}{2}=0.1124 \mathrm{~mol}$

$$
V_{\min }=\frac{n_{A} R T}{P}
$$

at 1 atm and $298 \mathrm{~K}, \quad V_{\min }=\frac{0.1124 \times 0.08206 \times 298}{1}=2.75 \mathrm{~L}$
h) Once a new state of equilibrium is reached the pressure of the system has changed and the volume of compartment 1 reach 4 L . Determine the value of the new equilibrium pressure in the container.

## 2 marks

$$
\begin{aligned}
& n_{A}=0.0204+\frac{0.184-n_{B}}{2}=\frac{0.0408+0.184-n_{B}}{2}=\frac{0.2248-n_{B}}{2} \\
& n_{A}=\frac{P_{A} V_{1}}{R T}=0.16357 P_{A} \text { and } n_{B}=\frac{P_{B} V_{1}}{R T}=0.16357 P_{B} \\
& \Rightarrow 0.16357 P_{A}=\frac{0.2248-0.16357 P_{B}}{2} \\
& P_{A}=\frac{0.2248-0.16357 P_{B}}{0.32714} \\
& \text { substitute in } \frac{P_{B}^{2}}{P_{A}}=8.1 \Rightarrow \frac{0.32714 P_{B}^{2}}{0.2248-0.16357 P_{B}}=8.1 \\
& \Rightarrow 0.32714 P_{B}^{2}=1.82088-1.324917 P_{B} \Rightarrow 0.32714 P_{B}^{2}+1.324917 P_{B}-1.82088 \\
& a=0.32714 \\
& b=1.324917 \\
& c=-1.82088 \\
& \sqrt{b^{2}-4 a c}=2.034 \\
& P_{B}=\frac{-1.324917+2.034}{2 \times 0.32714}=1.084 \mathrm{~atm} \\
& P_{A}=\frac{P_{B}^{2}}{8.1}=0.145 \mathrm{~atm} \quad P=P_{A}+P_{B}=1.23 \mathrm{~atm}
\end{aligned}
$$
